

The Fundamental Theorem of Arithmetic

The Fundamental Theorem of Arithmetic states that every positive integer, except the number one, can be represented in exactly one way apart from rearrangement as a product of a one or more prime numbers.

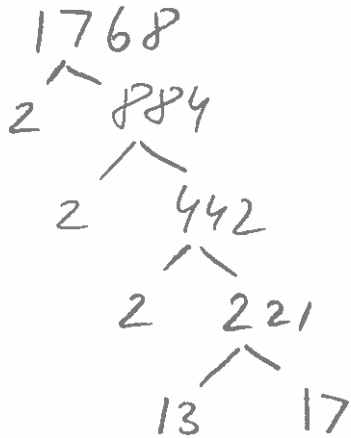

This theorem is sometimes referred to as The Unique Factorization Theorem.

Example 1: Express 6825 as a product of its prime factors.

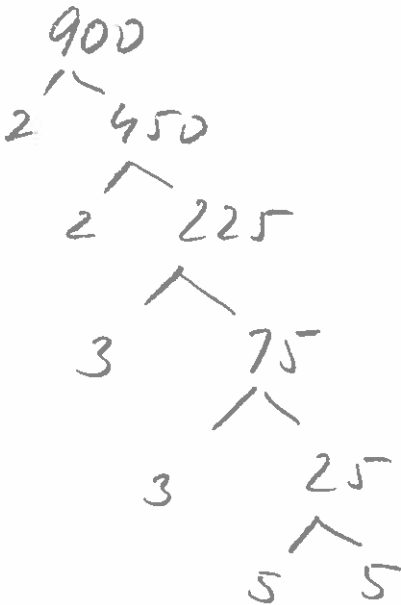

$$\therefore 6825 = (3)(5^2)(7)(13)$$

Example 2: Prime factorize 1768.

$$\therefore 1768 = (2^3)(13)(17)$$

Example 3: Prime factorize 900.

$$\therefore 900 = (2^2)(3^2)(5^2)$$

APPLICATION OF PRIME FACORIZATION

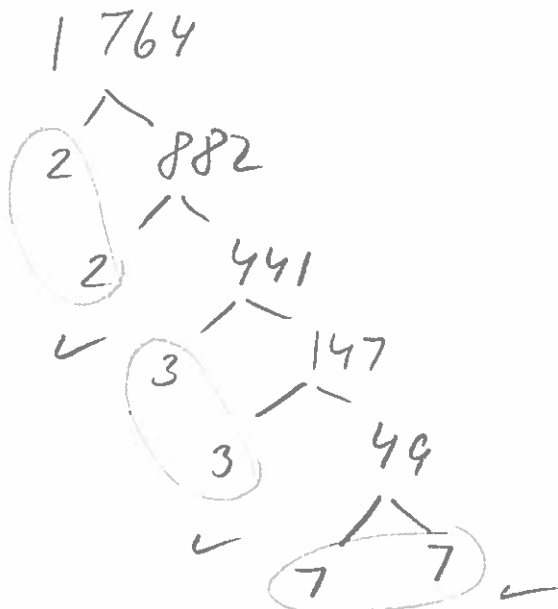

A: Using prime factorization to determine whether a given number is a (perfect) square (number).

Example 1: Determine whether 8450 is a perfect square. Justify your answer.

\therefore 8450 is NOT a square number.

Example 2: Determine whether 1764 is a perfect square number. Justify your answer.

\therefore 1764 is a square number because $1764 = (2^2)(3^2)(7^2) = (42)^2$.

B: Using prime factorization to determine whether a given number is a cube (number).

Note: A cube number can be expressed as a product of exactly three identical factors.

Examples of cube numbers:

Power	Number
0^3	0
1^3	1
2^3	8
3^3	27
4^3	64

5^3	125
6^3	216
7^3	343
8^3	512
9^3	729
10^3	1000

Example 1: Determine whether 2744 is a cube number. Justify your answer.

\therefore 2744 is a cube number because

$$2744 = (2^3)(7^3) = (2 \cdot 7)^3 = \underline{14^3}$$

Example 2: Determine whether 1125 is a cube number. Justify your answer.

\therefore 1125 is not a cube number,

Example 3: Determine whether 1728 is a ^{cube} or a square number. Justify your answer.

$$1728 = (2^3)(2^3)(3^3) = (2 \cdot 2 \cdot 3)^3 = \underline{\underline{12^3}}$$

\therefore 1728 is a cube number

\therefore 1728 is not a square number.

Example 4: Determine whether 7 529 536 is a cube or a square number. Justify your answer using prime factorization.

$$7\,529\,536 = (2^3)(2^3)(7^3)(7^3)$$

$$= (2 \cdot 2 \cdot 7 \cdot 7)^3$$

$$= 196^3$$

\therefore 7529 536 is a cube number.

$$7\,529\,536 = (2^2)(2^2)(2^2)(7^2)(7^2)(7^2)$$

$$= (2 \cdot 2 \cdot 2 \cdot 7 \cdot 7 \cdot 7)^2$$

$$= 2744^2$$

\therefore 7529 536 is a square number.

C: Using prime factorization to determine the least common multiple (LCM) of a pair or a group of numbers

Note: It is very useful to know the least common multiple of a group of numbers in order to find a common denominator needed to add and/or subtract fractions.

Example 1: Find the least common multiple (LCM) of 378 and 396.

$$\begin{array}{r}
 378 \\
 \wedge \\
 2 \quad 189 \\
 \quad \wedge \\
 \quad 3 \quad 63 \\
 \quad \quad \wedge \\
 \quad \quad 3 \quad 21 \\
 \quad \quad \quad \wedge \\
 \quad \quad \quad 3 \quad 7
 \end{array}$$

$$\begin{array}{r}
 396 \\
 \wedge \\
 2 \quad 198 \\
 \quad \wedge \\
 \quad 2 \quad 99 \\
 \quad \quad \wedge \\
 \quad \quad 3 \quad 33 \\
 \quad \quad \quad \wedge \\
 \quad \quad \quad 3 \quad 11
 \end{array}$$

$$378 = (2)(3^3)(7)$$

$$396 = (2^2)(3^2)(11)$$

$$\begin{aligned}
 \therefore \text{lcm}(378, 396) &= (2^2)(3^3)(7)(11) \\
 &= \underline{\underline{8316}}
 \end{aligned}$$

Example 2: Find the least common multiple (LCM) of 12, 18 and 54.

$$\begin{array}{r}
 12 \\
 \wedge \\
 2 \quad 6 \\
 \quad \wedge \\
 \quad 2 \quad 3
 \end{array}$$

$$\begin{array}{r}
 18 \\
 \wedge \\
 2 \quad 9 \\
 \quad \wedge \\
 \quad 3 \quad 3
 \end{array}$$

$$\begin{array}{r}
 54 \\
 \wedge \\
 2 \quad 27 \\
 \quad \wedge \\
 \quad 3 \quad 9 \\
 \quad \quad \wedge \\
 \quad \quad 3 \quad 3
 \end{array}$$

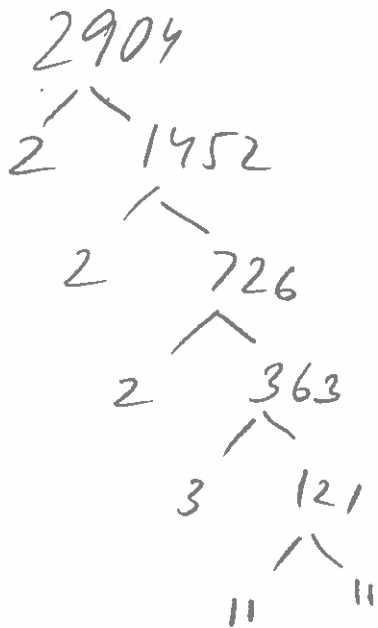

$$12 = (2^2)(3)$$

$$18 = (2)(3^2)$$

$$54 = (2)(3^3)$$

$$\therefore \text{lcm}(12, 18, 54) = (2^2)(3^3) = (4)(27) = \underline{\underline{108}}$$

Example 3: Find the least common multiple (LCM) of 2904 and 2860.

$$2904 = \underline{(2^3)} \underline{(3)} \underline{(11^2)}$$

$$2860 = \underline{(2^2)} \underline{(5)} \underline{(11)} \underline{(13)}$$

$$\begin{aligned} \therefore \text{lcm}(2860, 2904) &= (2^3)(3)(5)(11^2)(13) \\ &= \underline{\underline{188760}} \end{aligned}$$

D: Using prime factorization to determine the greatest common factor (GCF) of a pair or a group of numbers

Note: It is very useful to know the greatest common factor of a pair of a group of numbers when working with fractions because the greatest common factor can be factored out and the fractions can be simplified.

Note: If numbers do not have a prime factor in common, their $gcf = \underline{\underline{1}}$

Example 1: Find the greatest common factor (GCF) of 285 and 5445.

$$\begin{array}{c} 285 \\ \swarrow \quad \searrow \\ 3 \quad 95 \\ \quad \swarrow \quad \searrow \\ \quad 5 \quad 19 \end{array}$$

$$\begin{array}{c} 5445 \\ \swarrow \quad \searrow \\ 3 \quad 1815 \\ \quad \swarrow \quad \searrow \\ \quad 3 \quad 605 \\ \quad \quad \swarrow \quad \searrow \\ \quad \quad 5 \quad 121 \\ \quad \quad \quad \swarrow \quad \searrow \\ \quad \quad \quad 11 \quad 11 \end{array}$$

$$285 = 3 \times 5 \times 19$$

$$5445 = 3 \times 3 \times 5 \times 11 \times 11$$

$$\therefore gcf(285, 5445) = (3)(5) = \underline{\underline{15}}$$

Example 2: Find the greatest common factor of 234 and 147.

$$\begin{array}{c} 234 \\ \swarrow \quad \searrow \\ 2 \quad 117 \\ \quad \swarrow \quad \searrow \\ \quad 3 \quad 39 \\ \quad \quad \swarrow \quad \searrow \\ \quad \quad 3 \quad 13 \end{array}$$

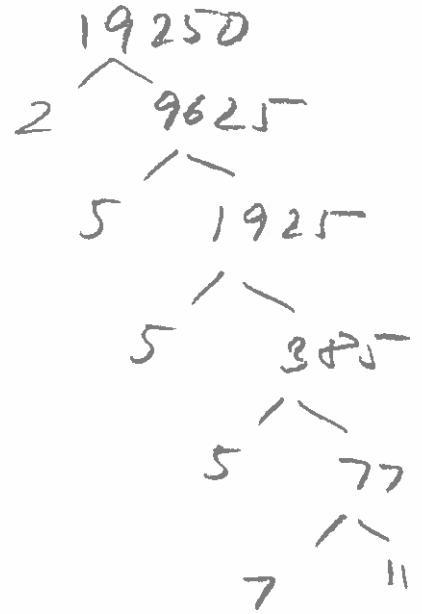

$$\begin{array}{c} 147 \\ \swarrow \quad \searrow \\ 3 \quad 49 \\ \quad \swarrow \quad \searrow \\ \quad 7 \quad 7 \end{array}$$

$$234 = 2 \times 3 \times 3 \times 13$$

$$147 = 3 \times 7 \times 7$$

$$\therefore gcf(147, 234) = \underline{\underline{3}}$$

Example 3: Find the greatest common factor of 660, 1650 and 19250.

$$660 = 2 \times 2 \times 3 \times 5 \times 11$$

$$1650 = 2 \times 3 \times 5 \times 5 \times 11$$

$$19250 = 2 \times 5 \times 5 \times 5 \times 7 \times 11$$

$$\therefore \text{gcf} = (2)(5)(11) = \underline{\underline{110}}$$

Example 4: Find the greatest common factor (GCF) of 84, 140 and 364.

$$\begin{aligned} 84 &= 2 \times 2 \times 3 \times 7 \\ 140 &= 2 \times 2 \times 5 \times 7 \\ 364 &= 2 \times 2 \times 7 \times 13 \end{aligned}$$

$$\begin{aligned} \therefore \text{gcf}(84, 140, 364) &= 2 \times 2 \times 7 \\ &= \underline{\underline{28}} \end{aligned}$$
