## 1.2 Factoring Numbers, GCF, and LCM

**A factor** is a whole number that divides another whole number without leaving a remainder.

**A prime factor** is a prime number that divides another whole number without leaving a remainder.

- Every counting number greater than one has at least two factors: 1 and itself

★ **A prime number** is a number that <sup>!! only !!</sup> has exactly two factors – 1 and itself. ★

Examples: 2, 3, 5, 7, 11, 13, 17, 19, 23, 29

**A composite number** is a number greater than 1 that has more than two factors.

Example of composite numbers:

4, 6, 8, 9, 10, 12, 14, 18, 20, 21, 22

Recall: number 1 and number 0 are neither prime nor they are composite!

Not prime  
or  
composite!

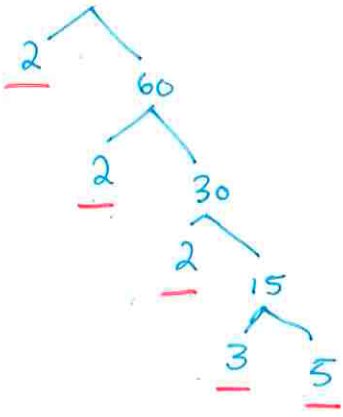

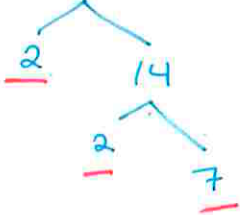

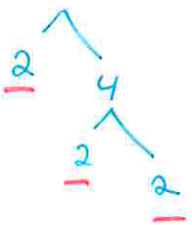

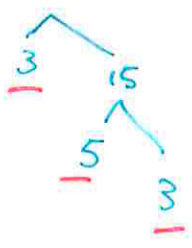

Task: List all the factors of each number:

36	56	28
1, 2, 3, 4, 6, 9, 12, 18, 36	1, 2, 4, 7, 8, 14, 28, 56	1, 2, 4, 7, 14, 28

### Prime Factorization – Writing Prime Factorization Tree

- Remember to always start with the smallest prime number and if it does not work, use the prime number that follows. Do not skip primes when writing prime factorization tree. Always try if the prime works before moving onto the next prime.

Task: Write a prime factorization tree for each number. Then use the tree to write the prime factorization statement.

<p style="text-align: center;">120</p> 	<p style="text-align: center;">28</p> 
<p><math>\therefore 120 = 2 \times 2 \times 2 \times 3 \times 5</math></p>	<p><math>\therefore 28 = 2 \times 2 \times 7</math></p>
<p style="text-align: center;">8</p> 	<p style="text-align: center;">45</p> 
<p><math>\therefore 8 = 2 \times 2 \times 2</math></p>	<p><math>\therefore 45 = 3 \times 5 \times 3</math></p>

GCF – greatest common factor  
“Noodle Method”

To find the greatest common factor of two or more numbers is to find the largest number that divides both or all given numbers.

Steps:

1. Write a prime factorization tree for each given number.
2. Write the prime factorization for each given number.
3. Circle factors that appear in both (or all) lists.
4. Find the product of these factors.
5. State the final answer.

Example: What is the greatest common factor of 28 and 98? Show all your work.

$$28 = 2 \times 2 \times 7$$
$$98 = 2 \times 7 \times 7$$

$$2 \times 7 = 14$$

$\therefore$  Therefore  $GCF(28, 98) = 14$ .

$$60 = 2 \times 2 \times 3 \times 5$$
$$910 = 2 \times 5 \times 7 \times 13$$

$$2 \times 5 = 10$$

$\therefore$   $GCF(60, 910) = 10$ .

Practice: Find the GCF for each pair of numbers. Show all your work.

18, 24

$$18 = 2 \times 3 \times 3$$

$$24 = 2 \times 2 \times 2 \times 3$$

$$\text{GCF} = 2 \times 3$$

$$\text{GCF} = 6$$

$$\therefore \text{the GCF}(18, 24) = 6$$

35, 120

$$\therefore \text{the GCF}(35, 120) = 5$$

$$35 = 5 \times 7$$

$$120 = 2 \times 2 \times 2 \times 5 \times 3$$

$$\text{GCF} = 5$$

45, 189

$$45 = 5 \times 3 \times 3$$

$$189 = 3 \times 3 \times 3 \times 7$$

$$\text{GCF} = 3 \times 3$$

$$\text{GCF} = 9$$

$$\therefore \text{the GCF}(45, 189) = 9$$

26, 51

$$26 = 2 \times 13$$

$$51 = 3 \times 17$$

\* There is no noodles  
Therefore 1 is GCF \*

$$\therefore \text{the GCF}(26, 51) = 1$$

### LCM – The least common multiple

- To find the least common multiple of two numbers is to find the smallest number to which both numbers multiply to.
- There are two different methods to find the LCM
  - Listing all multiples before finding the common one.
  - Prime factorizing and selecting all unique factors and factors that repeat the most.

Example: Find the least common multiple of 6 and 14 by listing multiples.

$$6: 6, 12, 18, 24, 30, 36, \textcircled{42}, 48, 54, \dots$$

$$14: 14, 28, \textcircled{42}$$

$$\therefore \text{lcm}(6, 14) = 42$$

Example: Using prime factorization, find the least common multiple of 126 and 420.

$$126 = 2 \times \underline{3} \times \underline{3} \times 7$$

$$420 = \underline{2} \times \underline{2} \times \underline{3} \times \underline{5} \times \underline{7}$$

$$\text{lcm} = 3 \times 3 \times 2 \times 2 \times 5 \times 7 = 1260$$

$$\therefore \text{Lcm}(126, 420) = 1260$$

Practice:

Using prime factorization, find the least common multiple for the given pairs of numbers.

<p>20, 130</p>	<div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> <math display="block">\begin{array}{c} \underline{20} \\ \swarrow \quad \searrow \\ 2 \quad 10 \\ \quad \swarrow \quad \searrow \\ \quad 2 \quad 5 \end{array}</math> </div> <div style="text-align: center;"> <math display="block">\begin{array}{c} \underline{130} \\ \swarrow \quad \searrow \\ 2 \quad 65 \\ \quad \swarrow \quad \searrow \\ \quad 5 \quad 13 \end{array}</math> </div> <div style="text-align: left;"> <p><math>20 = \underline{2 \times 2} \times \underline{5}</math>  <math>130 = 2 \times 5 \times \underline{13}</math></p> <p><math>lcm = 2 \times 2 \times 5 \times 13</math>  <math>= \boxed{260}</math></p> </div> </div> <p><math>\therefore lcm(20, 130) = 260</math></p>
<p>143, 1001</p>	<div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> <math display="block">\begin{array}{c} \underline{143} \\ \swarrow \quad \searrow \\ 11 \quad 13 \end{array}</math> </div> <div style="text-align: center;"> <math display="block">\begin{array}{c} \underline{1001} \\ \swarrow \quad \searrow \\ 7 \quad 143 \\ \quad \swarrow \quad \searrow \\ \quad 11 \quad 13 \end{array}</math> </div> </div> <p><math>lcm: 11 \times 13 \times 7 = 1001</math></p> <p><math>\therefore lcm(143, 1001) = 1001</math></p>
<p>42, 132</p>	<div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> <math display="block">\begin{array}{c} \underline{42} \\ \swarrow \quad \searrow \\ 2 \quad 21 \\ \quad \swarrow \quad \searrow \\ \quad 3 \quad 7 \end{array}</math> </div> <div style="text-align: center;"> <math display="block">\begin{array}{c} \underline{132} \\ \swarrow \quad \searrow \\ 2 \quad 66 \\ \quad \swarrow \quad \searrow \\ \quad 2 \quad 33 \\ \quad \quad \swarrow \quad \searrow \\ \quad \quad 3 \quad 11 \end{array}</math> </div> <div style="text-align: left;"> <p><math>lcm = 2 \times 2 \times 3 \times 7 \times 11</math>  <math>lcm = 924</math></p> </div> </div> <p><math>42 = 2 \times 3 \times 7</math>  <math>132 = \underline{2 \times 2} \times \underline{3} \times \underline{11}</math></p> <p><math>\therefore lcm(42, 132) = 924</math></p>
<p>46, 575</p>	<div style="display: flex; justify-content: space-around; align-items: flex-start;"> <div style="text-align: center;"> <math display="block">\begin{array}{c} \underline{46} \\ \swarrow \quad \searrow \\ 2 \quad 23 \end{array}</math> </div> <div style="text-align: center;"> <math display="block">\begin{array}{c} \underline{575} \\ \swarrow \quad \searrow \\ 5 \quad 115 \\ \quad \swarrow \quad \searrow \\ \quad 5 \quad 23 \end{array}</math> </div> </div> <p><math>46 = \underline{2} \times 23</math>  <math>575 = \underline{5} \times \underline{5} \times \underline{23}</math></p> <p><math>lcm = 2 \times 5 \times 5 \times 23</math>  <math>lcm = 1150</math></p> <p><math>\therefore lcm(46, 575) = 1150</math></p>
